

INSTALLATION INSTRUCTIONS

STEP 1 The Kozy Kollar will work on a 0 to 12 pitch roof. After selecting the area where the Kollar is to be installed. Remove any nails that penetrate the roof in the area of the lower mounting plates. This can be done by positioning a sawzall at a right angle to the nail and cutting it off flush with the sheathing.

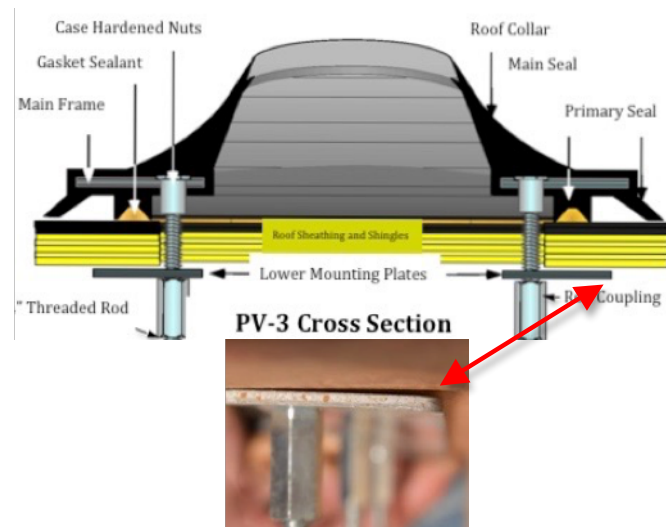

STEP 2 Using the template supplied mark the area to be cut out. Use the centerline mark on the template to locate where your pipe is to penetrate the roof. Care should be taken when positioning the template. To set the roof Kollar square with the outside of the building the template should be aligned with a framing member (roof rafter, plywood seam, ect.). The outside of the template should be kept 2" from rafters or other obstructions.

STEP 3 Using a sawzall fitted with a rough-in blade cut out the marked rectangle from the roof. It is critical to cut along the line as close as possible. Do not cut outside the line. The downward pull of the blade will cut the shingles cleanly. The Kozy Kollar can be installed in any weather just clear the roof of any debris, ice, or snow where the Kollar will sit.

STEP 4 Install the four corner studs in to the Kozy Kollar, apply a thin bead of the gasket sealant supplied with the Kozy Kollar into the caulking channel of the primary seal. Pass the Kollar through the hole cut in the roof. Set the Kozy Kollar on the roof the four corner studs will hold the Kollar in place.

STEP 5 Install the remaining studs, the lower mounting plates, and rod couplings. The Kozy Kollar **REQUIRES COMPRESSION TO WORK.** Starting with the top studs tighten the rod couplings to approximately 3 foot pounds.

If a Torque Wrench is not available tighten the rod couplings until the lower mounting plates begin to distort.

For Architectural and Conventional Shingles

Will work on metal, rolled roofing and EPDM roofs visit our website for details
